CHICK

Our hatcheries, the largest hatchery capacity both in Turkey and Europe, have early detection alarm systems with 24/7 monitoring capability.

Eggs from parent stock facilities are classified in hatcheries by special teams in line with customer demands and expectations. Conforming to the quality policy, the loading process is carried out on the machines based on the philosophy of "one flock for each customer". Chicks hatch after completing their development in the latest system computer-controlled setter for 18 days and 3 days in the hatcher. After the necessary classification and vaccination processes are completed, they are shipped to the respective customers.
